1.Introduction

1.1 Product Description

Our hydrophilic PVDF 0.45µm filter cartridges are sterilize grade cartridge filters manufactured from hydrophilic PVDF membrane and polypropylene hardware providing high flow rates and throughputs, low extractable, broad chemical compatibility. These cartridge filters are 100% integrity tested during manufacturing to assure sterilizing-grade performance.

The hydrophilic PVDF $0.45\mu m$ filter cartridges are designed for removal of particles and the sterile filtration of aqueous solutions.

The hydrophilic PVDF 0.45µm filter cartridges are designed, developed and manufactured in accordance with an ISO 9001:2015 certified quality management system. These filters are manufactured in a controlled environment that meets the air quality standards of an ISO class 8 room with respect to viable and nonviable particulate and positive pressure.

1.2 Materials of Construction

1.2.1Component materials used in this product meets the FDA Indirect Food Additive requirements cited in 21 CFR 177-182.

| requirements enter in 2.1 er iv in 7.1 lez. | | | | |
|---|---------------------------|--|--|--|

3. Test Methods and Results

3.1Correlation of non-destructive integrity testing to liquid bacterial challenge with Serratia marcescens(ATCC 14756) for sterilize grade filters

3.1.1 Introduction

The FDA guidelines on Sterile Products Produced by Aseptic Processing (2004) state, "A sterilizing filter is one which, when challenged with the micro-organism *Serratia marcescens*, at a minimum concentration of 10⁷ organisms per cm² of filter surface, will produce a sterile effluent".

In order to meet the requirements of this guideline, liquid challenge tests using *Serratia* marcescens (ATCC 14756) were performed with hydrophilic PVDF 0.45 μ m filter cartridges using a minimum of 1x10⁷ colony forming units (CFU)/cm² of effective filtration area.

The correlation between microbial retention and a non-destructive integrity test is also an important aspect of the validation of sterilizing grade filters. The FDA guideline further states, "After a filtration process is properly validated for a given product, process and filter, it is important to assure that identical filter replacements (membrane or cartridge) used in production runs will perform in the same manner. One way of achieving this is to correlate filter performance data with filter integrity testing data". The integrity tests used during this validation study were the Forward Flow and Bubble Point tests.

The Forward Flow Integrity Test

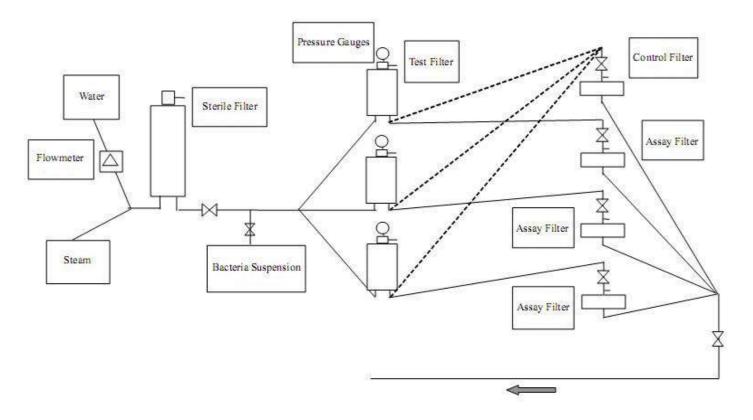

In the Forward Flow test, a filter is wetted with a suitable test liquid and a pre-determined gas pressure is applied to the upstream side of the filter assembly. After a stabilization period, the gas flow through the wetted membrane can be measured manually on the downstream side or on the upstream side, using sensitive flow measurement equipment such as the integrity test devices.

The Bubble Point Integrity Test

In the Bubble Point test, a filter is wetted with a suitable test liquid. After a stabilization period, increasing the gas pressure to the upstream side of the filter assembly, using sensitive flow measurement equipment such as the integrity test devices to test the change point of the gas flow rate.

3.1.2 Summary of Methods

Hydrophilic PVDF0.45µm filter with different batch lots were subjected to microbial challenge tests using an aqueous suspension of *Serratia marcescens*(ATCC 14756).

Prior to the challenge tests the filters were installed in an appropriate housing, flushed with DI water at a flow rate of 4 L/min for 15~20 minutes, and then autoclaved at 121 °C for 30 minutes. The filter assembly was then aseptically connected to a pre-sterilized challenge apparatus.

A Forward Flow integrity test was then performed using an integrity test instrument with an air test pressure of 0.12Mpa (17.4 psi).

An aqueous suspension of Serratia marcescens was passed through the filter to achieve a challenge level of $> 1 \times 10^7$ colony forming units (CFU) per cm² of effective filtration area.

During the challenge test, the entire filter effluent was passed through a 0.45 μ m-rated analysis disc on the downstream side of the test filter assembly. The filter disc was incubated on TSA and following incubation, the disc was examined to determine if any colonies had grown, indicating whether or not bacteria had passed through the test filter during the challenge.

3.1.3 Test Results

Table listed below indicates hydrophilic PVDF 0.45 μ m that are forward flow tested before and after bacterial challenge. The bacterial challenge was conducted using ASTM F838-20 to provide the necessary correlation between a bacterial challenge and a non-destructive integrity test. The table also indicates that a hydrophilic PVDF 0.45 μ m filter with Forward Flow ≤16.0 mL/min/10"@ 1.2bar at 20 °C has sterile filtration efficiency when challenged with > 1 x 10⁷ CFU per cm² of filtration area using Serratia marcescens.

Filter type: Hydrophilic PVDF 10", 0.45µm

Challenge organism: Serratia marcescens(ATCC 14756)

| Filter Serial | Forward Flow | Challenging | Sterile | LRV/ |

3.1.4 Conclusions

A typical hydrophilic PVDF Series $0.45\mu m$ filters from production, 27pcs were found to pass the forward flow integrity test. The table also indicates that hydrophilic PVDF $0.45\mu m$ filter with Forward Flow $\leq 17.1 \, mL/min/10$ "@ 1.2bar at $20\,^{\circ}C$ has sterile filtration efficiency when challenged with $> 1 \times 10^7$ CFU per cm² of filtration area using *Serratia marcescens*.

Analysis in base of results of forward flow, tested filter ≤16mL/min gave sterile effluent when challenged with LRV>7 of Serratia marcescens.

3.2Integrity Test Standard(20±5℃)

In base of test results of validation test, forward flow is approved as suitable test methods for hydrophilic PVDF 0.45 μ m filter cartridges. We also test the bubble point before and after bacterial challenge. The hydrophilic PVDF 0.45 μ m filter with bubble point \geq 1.6bar at 20 $^{\circ}$ C has sterile filtration efficiency.

The Integrity test value standard is as below:

| Wetting Liquid | | DI Water | | | |
|---------------------------------|---------------|----------|--|--|--|
| Temperature | 20±5 ℃ | | | | |
| Test Gas | | Air | | | |
| Allowable integrity Value limit | Forward Flow: | | | | |
| Allowable Integrity Value limit | Bubble Point: | ≥1.6bar | | | |

3.3 Flow Characteristic(20±5℃)

3.3.1 Summary of Methods

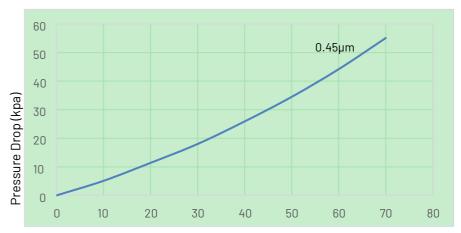

Typical hydrophilic PVDF $0.45\mu m$ filter Cartridge from production were used for the tests. The filters were flushed with DI water@1.0bar for15-20mins. Then passed forward flow in base of 1.2bar air test pressure.

Standard production hydrophilic PVDF $0.45\mu m$ filter cartridge (10", EFA $0.6m^2$) were installed with flow rate test system device, which adjust the flow rate and pressure drop by auto-valve. Then take the continuous records with flow rate, upstream & downstream pressure value, temperature etc.

3.3.2 Test Results

Here is the flow chart of filter cartridge.

Flow Rate@20°C (L/min)

3.3.3 Conclusions

These data can be used to assist users in sizing filter systems.

3.4 Maximum Operating Conditions

3.4.1Summary of Methods

Typical hydrophilic PVDF $0.45\mu m$ filter Cartridge from production were used for the tests. The filters were flushed with DI water@1.0bar for $15\sim20mins$. Then passed forward flow in base of 1.2bar air test pressure.

Standard production hydrophilic PVDF 0.45µm filter cartridge(10", EFA 0.6m²) were installed with pressure drop test system device, which adjust the upstream and downstream pressure by autovalve.

Use ISO Standard powers to increase the pressure drop till 5.0bar , temperature 25° C and keep the pressure for 30mins, total 4 cycles.

Use Standard test dust to increase the pressure drop till 2.0bar,temperature 80° C and keep the pressure for 30mins, total 3 cycles. Then test the integrity.

3.4.2 Test Results

| 5 '' 0 ' 1 | Integrity Test(Bef pressure test | | Integrity Test(After the | ne pressure |

The Integrity test value standard is forward flow \leq 16mL/min@1.2bar,bubble point \geq 1.6bar,test temperature 20 \pm 5 $^{\circ}$ C.

3.4.3 Conclusions

Here is the Max. pressure drop and temperature of filter cartridge

| Maximum Differential Pressure (Forward) | Maximum Operating Temperature |
|---|-------------------------------|
| 5.0bar @ 25 °C | 80°C |
| 2.0bar @ 80 °C | |

3.5 Steam Sterilization(Thermal Stability)

3.5.1 Summary of Methods

The purpose of these tests was to determine the effects of repeated exposure to in-line steam or autoclave cycles on filter integrity using standard hydrophilic PVDF $0.45\mu m$ filters from production. The filters were flushed with DI water @1.0bar for $15\sim20mins$. Then passed forward flow in base of 1.2bar air test pressure.

During this autoclave study, filters were steamed using high initial differential pressures (1.0 bar (14.5 psi)) at $125^{\circ}\text{C} (257^{\circ}\text{F})$. The tests were performed in 30 minutes cycles in the forward (out to in) direction.

During the on-line steam sterilization, These filter cartridges were installed in stainless steel housing and steamed in place in the forward (out to in) direction using saturated steam at constant pressure and flow while ensuring effective condensate drainage. After each steam-in-place cycle the filters were cooled by passing dry compressed air through them.

Integrity tests maintained integrity after Sterilized in place and Autoclave to determine the ability of the filter to provide a sterile filtration.

3.5.2 Test ResultsForward Flow (mL/min) after the following Number of 30 minutes Steam Cycles.

| Serial No. | 0Cycles | 10cycles | 30cycles | 50cyecles | 100cycles | 150cycles |
|--------------|---------|----------|----------|-----------|-----------|-----------|
| 402200511016 | 10.5 | 10.7 | 10.3 | 11.1 | 11.2 | 11.3 |
| 402200511017 | 12.7 | 12.8 | 12.4 | 13.0 | 12.9 | 12.6 |
| 402200511018 | 10.7 | 11.1 | 10.8 | 10.9 | 11.5 | 11.2 |

The Integrity test value standard is forward flow≤16mL/min@1.2bar, test temperature 20±5°C.

3.5.3 Conclusions

Hydrophilic PVDF0.45µm filters have been demonstrated to be capable of withstanding multiple in-line steam/autoclave sterilization cycles.

The data presented in this section support the following product claims for in-line steaming/autoclaving hydrophilic PVDF0.45µm filter cartridges:

| Sterilized in Place | | | | | Autoclave | |
|---------------------|-------|-------|--------|-------|-----------|--------|
| Temp. | Time | ΔΡ | Cycles | Temp. | Time | Cycles |
| 135℃ | 30min | 30kPa | 50 | 125℃ | 30min | 150 |

3.6 Cleanness

3.6.1Gravimetric Extractable

3.6.1.1Summary of Methods

Typical hydrophilic PVDF0.45µm filter Cartridge from production were used for the tests.

Preparation of Filter Samples

Extractables tests were performed on typical production filter cartridges (10inch, 0.6m²), which had been autoclaved in order to maximize the quantity of any extractable material present. The filters were wrapped in aluminium foil and autoclaved for half hour at 121°C, using a slow exhaust cycle. Visible droplets of water remaining on the filter elements were allowed to evaporate at room temperature before the extraction was performed.

Extraction Procedure

Dynamic extraction tests were performed. The test filters were immersed in 1800 ml of extraction fluid in a clean measuring cylinder for 24 hours. For four hours the filter was gently moved up and down. This movement created flow through the filter membrane as a result of the pressure head that was created each time the element was partially lifted out of the liquid.

Analysis of Material Extracted

After the extraction, 1500mL of the extraction liquid was evaporated to dryness and the non-volatile extractable were determined gravimetrically.

3.6.1.2 Test Results

| Extraction Fluid | Filter serial number | Gravimetric Extractable (milligrams per Filter) | Average(milligrams) | |
|------------------|----------------------|---|---------------------|--|
| | 402200511021 | 13.1 | | |
| DI Water | 402200511022 | 15.4 | 14.4 | |
| | 403060211018 | 14.8 | | |

3.6.1.3 Conclusions

The extractable determined of hydrophilic PVDF0.45µm filter cartridge were depended by different solvent. The extractable levels under different solvents, different solubility, different temperature and different contact time are not consistent, so it is recommended to test under actual process conditions.

3.6.2 Fiber Releasing

3.6.2.1 Summary of Methods

Typical hydrophilic PVDF 0.45µm filter Cartridge from production were used for the tests.

Filters were autoclaved for one cycle of 30 minutes, 121° C, and then flushed with a total of 10 liters of 0.1 µm filtered water at a flow rate of 1 L per minute. The filtrate was passed through a 0.65µm black gridded disc filter to collect any fibers removed from the filter. Filters were then integrity tested to verify that only integral filters were used in the test.

3.6.2.2 Test Results

| hydrophilic PVDF0.45µm Filter – Fiber Shedding Results | | | | | | |
|--|------------------------------|---------------------------------------|--|--|--|--|
| Filter serial number | Number of Fibers in filtrate | Forward Flow(mL/min/10"@ 1.2bar,20 ℃) | | | | |
| 403120111019 | 0 | 12.1 | | | | |
| 403120111020 | 0 | 13.5 | | | | |
| 403060211019 | 0 | 12.6 | | | | |

The Integrity test value standard is forward flow≤16mL/min@1.2bar,test_temperature 20±5℃.

3.6.2.3 Conclusions

The hydrophilic PVDF0.45µm filter cartridge from production don't have Fiber releasing and meet the request of FDA 21 CFR 210.3(b)(6).

3.7 Biological Safety

3.7.1 Biological Tests

3.7.1.1 Summary of Methods

These filters are non-toxic per USP Class VI Biological Tests for Plastics.

Systemic Injection Test, Intracutaneous Test as well as Implantation Test were performed to determine the toxicity of this filters. This testing was performed by an independent laboratory.

3.7.1.2 Conclusions

The materials used in hydrophilic PVDF0.45µm filter cartridges from production met the specifications for Biological Reactivity Tests, in vivo, listed in the current revision of the United States Pharmacopeia (USP) for Class VI –121 °C Plastics.

3.7.2Bacterial Endotoxin: LAL Test

3.7.2.1Summary of Methods

The test filter was flushed with each of endotoxin-free normal saline . The filtration amount of per filter area is not more than $1mL/cm^2$. Ensure normal saline flow through the entire filter. The aqueous extract was tested with an LAL reagent and all tubes were incubated at $37\pm1^{\circ}C$ for $60\pm2min$.

3.7.2.2 Test Results

Extracts from filters contain <0.25EU/mL endotoxin units per milliliter per the USP Bacterial Endotoxins Test. The results are shown in the following table.

| hydrophilic PVDF0.45µm filterBacterial Endotoxin: LAL Test per USP(+Clotted;- Not Clotted) | | | | | | | |
|---|---------------------|---------------------|---|------------------|-----------------------------|--|--|
| Filter series number | Positive Control | Negative Control | Positive control of test solution | Test solution | Test results (0.25EU/mL) | | |
| 403060211020 | | | + + | | <0.25 | | |
| 403060211022 | | | + + | | <0.25 | | |
| 402200511023 | | | + + | | <0.25 | | |
| 402200511024 | + + | | + + | | <0.25 | | |
| 403120111022 | | | + + | | <0.25 | | |
| 403120111024 | | | + + | | <0.25 | | |

3.7.2.3 Conclusions

The hydrophilic PVDF0.45µm filter cartridges from production met the specifications for USP Bacterial Endotoxins Test.

3.8 Chemical Compatibility

The chemical compatibility of hydrophilic PVDF0.45 μ m filters is shown in the chart below. Recommendations are based upon static soak for 72 hours at 25°C and 1.0 atmosphere (14.5 psi,1.01 bar absolute) pressure. Dynamic (operating) conditions at moderate temperatures ($\pm 10\%$ fluctuation) will not change the recommendations, but high liquid temperature may do so in some cases.

NOTE: This data is intended to provide expected results when filtration device are exposed to chemicals under static conditions for 48hours at $25\,^{\circ}$ C, unless otherwise noted, membrane integrity was tested by bubble point.

This chart is intended only as a guide. User should verify chemical compatibility with a specificfilter under actual use condition, such as various temperatures, pressure, and concentration.

R = Resistant.

L = Limited resistance

N = Not resistant
